Human beings do not use all of their cognitive faculties equally. The works of leading Behavioral Economists and insights from other independent research confirm the presence of blind spots, fixation and biases in our day-to-day decision-making processes. For leaders, sound and fair decisions and their successful implementation is key to their own performance and the organisation's.

Decisioning is an extremely unique program for opening up perspectives and developing newer cognitive muscles for decision making. When the blind spots and biases are brought to surface through deliberate reflection on simulated experiences, it creates a sustained expansion of awareness, thinking and overall cognition.

This creates a transformational impact on Decision Making, leverages diversity of ideas and facilitates Innovation and Implementation.

Rooted in the work of Carl Jung, it also uses latest research from the fields of Cognitive Psychology, Behavioural Economics and Neuroscience.
